

Saket Suraj

Senior Software Engineer (Backend)

Bengaluru, India | +91 8073005774 | saket.suraj57@gmail.com | linkedin.com/in/saket-suraj-972673158 | github.com/Saketsuraj

PROFESSIONAL SUMMARY

Backend Software Engineer with **5 years of experience** designing, developing, and owning scalable services across healthcare AI, B2B SaaS data governance, and e-commerce domains. Deep expertise in **Node.js and Python**, with strong secondary skills in Go, React.js, and Next.js. Proven track record architecting distributed systems, microservice platforms, REST APIs, and cloud-native infrastructure (AWS, GCP, Azure) across a product-based startup and an MNC.

WORK EXPERIENCE

Senior Software Engineer (Backend) | **Precisely** - Bengaluru, India

Aug 2024 – Present

- Working on **Precisely Data Integrity Suite Govern**, a **B2B SaaS data governance platform** used by **Fortune 100 enterprises** to catalog, search, trace, and manage **millions of business-critical data assets** at scale.
- Core contributor to the **Data Catalog microservice** (Node.js/TypeScript, Express, MongoDB, AWS SQS, Redis, S3) serving as the backbone service managing catalog assets, semantic types, ownership, lineage, search, and background workflows.
- Delivered **8+ production features** including JSON Schema metadata for nested Field assets; filter-based asset deletion with dry-run support; semantic type tagging for classifications like Email Address and Phone Number; and multiple OpenAPI contract and observability enhancements.
- Improved production readiness through Jest test coverage, GitLab CI/CD pipelines, Docker deployments, and security tooling (SonarQube, Checkmarx, BlackDuck).
- Day-to-day** responsibilities include building REST APIs, managing databases, code reviews, bug fixes, documentation, and software deliveries.

Tech used: Node.js (Express, Hono, Bun), Python (FastAPI), TypeScript, PostgreSQL (Sequelize), MongoDB (Mongoose), Redis, AWS (SQS, S3, EC2, Lambda), Docker, Kubernetes, GitLab CI/CD, Datadog, LaunchDarkly, SonarQube, Checkmarx, BlackDuck, Jest

Sigtuple | **Bengaluru, India**

Jun 2021 – Aug 2024

Software Development Engineer II (Backend) · **Promoted** - Apr 2024 – Aug 2024

- Involved in **architecture discussions** to design the next-generation device capable of scanning **10 slides simultaneously** - contributed to system design decisions around concurrency, inter-service communication, and data pipeline architecture.
- Developed **8 Python and Node.js microservices** from scratch for the new product, with services responsible for scan orchestration, data ingestion, image processing coordination, device state management, and clinical reporting.
- Used **NATS** as the messaging broker and inter-service communicator across all microservices - enabling reliable, low-latency event-driven communication between device-side and cloud-side services.
- Built a **new cloud-based diagnostic reporting system** (Node.js, MongoDB) for the next-gen device, enabling doctors to review AI-generated scan findings, validate results, and generate clinical reports.
- Built a **Debian-based software upgrade system** using Linux and Python packaging - enabling OTA-style firmware and software updates to be deployed reliably across hospital-installed devices without manual intervention.

Tech used: Node.js (Express), Python (FastAPI, Flask), NATS, MongoDB (Mongoose), MySQL (SQLAlchemy), PostgreSQL, Redis, GCP, AWS, Docker, Kubernetes, Jenkins, GitLab CI/CD, Bash, Linux, Jest, PyTest

Software Development Engineer I (Backend) - Jun 2021 – Mar 2024

- **Developed 20+ production features as a** major contributor like increasing the device's scanning capability from **1 slide to 3 slides simultaneously** and redesigning the concurrency model of the scan workflow to coordinate parallel hardware operations, data persistence, and failure recovery across multiple slides.
- Built and scaled **concurrent cloud report generation** and enabled multiple diagnostic reports to be processed and delivered in parallel, reducing clinician wait time and improving throughput for high-volume hospital deployments.
- Designed and developed backend software for the hospital-facing blood slide scanner - engineered high-volume data ingestion pipelines processing thousands of image records with transactional integrity and full clinical traceability (Python, MySQL).
- Built firmware-facing backend workflows to translate clinician scan requests into device operations - coordinating scanner execution, data persistence, status updates, and multi-step failure recovery.
- Applied TDD and Domain-Driven Design across healthcare domains - reduced production defects and improved API data caching using Redis

Tech used: Node.js (Express), Python (Flask, FastAPI), MySQL (SQLAlchemy), MongoDB (Mongoose), Redis, GCP, AWS, Docker, Jenkins, GitLab CI/CD, Bash, Linux, React.js, PyTest, Jest

INTERNSHIPS

Full Stack Development Intern | **OpenApp**

Aug 2020 – Jun 2021

- Built backend APIs and data models for an e-commerce platform supporting smart lock devices, covering product lifecycle, order flows, and device-user associations.
- Developed an inventory management system using Magento 2 and Node.js; contributed frontend components in Angular.

Tech used: Node.js (Koa), MongoDB (Mongoose), Angular, Magento 2, AWS

Full Stack Development Intern | **Sleefax**

Apr 2020 – Jun 2020

- Built backend workflows and cloud-hosted services for order intake and management systems for small businesses.

Tech used: PHP, Firebase, JavaScript, HTML, CSS

Full Stack Development Intern | **Lightning Speed Events**

Feb 2019 – Jun 2019

- Integrated Eventbrite API to surface upcoming US events on an event management platform; built full-stack data-driven features.

Tech used: PHP, MySQL, jQuery, HTML, CSS, JavaScript, Eventbrite API

EDUCATION

Bachelor of Technology (B.Tech) | Manipal University Jaipur - Jun 2017 – Jun 2021
